

## Fractions can also be written in other forms.

These forms are:

- Fractions (which we have covered in the first 2 lessons)
- Decimals
- Percents

	<b>Fraction</b>	<b>Decimal</b>	<b>Percent</b>
<b>Example1</b>	$\frac{1}{2}$	0.50	50%
<b>Example2</b>	$\frac{3}{4}$	0.75	75%

So, how do we convert (or change) these fractions into decimals and percents?

We will learn how to do this in the next lesson. Below is a summary of what we have learned so far.

Summary: 4 things to remember about fractions.

- Fractions are Division
- Whole Numbers can be written as fractions by putting a "1" in the denominator.
- Fractions are part of a whole.
- Fractions have 3 components (parts)
  1. Numerator (Top Number)
  2. Fraction Bar (means "divided by" or "out of")
  3. Denominator (Bottom Number)
